Chapter 1: HTML Fundamentals

HTML (HyperText Markup Language) is the backbone of every web page.

Basic structure:

```
<!DOCTYPE html>
<html lang='en'>
<head>
  <meta charset='UTF-8'>
  <title>My Page</title>
</head>
<body>
  <h1>Hello World</h1>
  <p>Welcome!</p>
</body>
</html>
```

Semantic elements: header, nav, main, article, section, footer.

Chapter 2: CSS Styling

CSS controls the visual presentation of HTML elements.

Selectors:

```
p { color: red; }      /* tag */  
.card { padding: 16px; } /* class */  
#hero { background: blue; } /* id */
```

Layout systems:

- Flexbox: one-dimensional layouts
- Grid: two-dimensional layouts
- Position: absolute/relative/fixed

Chapter 3: JavaScript and React

JavaScript adds interactivity to web pages.

Modern JS features (ES2020+):

- Arrow functions: `const add = (a, b) => a + b`
- Destructuring: `const { name, age } = person`
- Async/await: `const data = await fetch(url).then(r => r.json())`

React is a component-based UI library:

```
function App() {  
  const [count, setCount] = useState(0)  
  return <button onClick={() => setCount(c => c+1)}>{count}</button>  
}
```
